imagination at work

Recipe for MRI

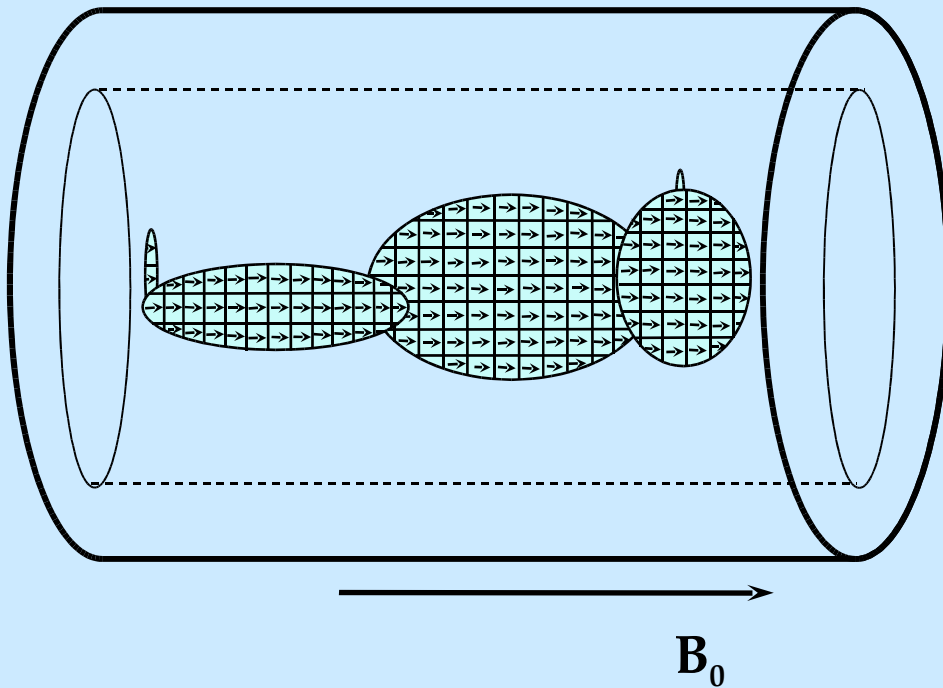

- 1) Put subject in big magnetic field
- 2) Transmit radio waves into subject
(a few ms)
- 3) Receive radio waves re-transmitted by subject
 - Manipulate re-transmission with magnetic fields during this *readout* interval (10 -100 ms order : MRI is not a snapshot)
- 4) Store measured radio wave data vs. time
 - Now go back to 2) to get some more data
- 5) Process raw data to reconstruct images
- 6) Allow subject to leave scanner (this is optional)

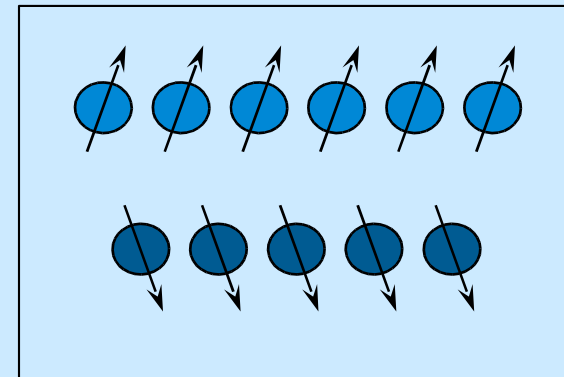

MRI Recipe

Step 1: Put the patient into a big magnetic field.

The magnetic field is used to align water molecules or “spins” within the body...

No Magnet Field
(Random Spin Orientation. Sum = 0)

$B_0 = 1.5T, \text{ or } 3T \dots$
(Spins Align... Sum = \mathbf{M})

MRI Recipe

Step 2: Transmit radio waves into subject.

A pulse sequence is used to “excite” sections of spins using radio waves (RF excitation)...

MRI Recipe

Step 3: Receive radio waves re-transmitted by subject.

After excitation, the magnetization precesses around the main field (B_0). Any RF coil nearby will pick up the signal or “echo” as the magnetization spins around the main field...

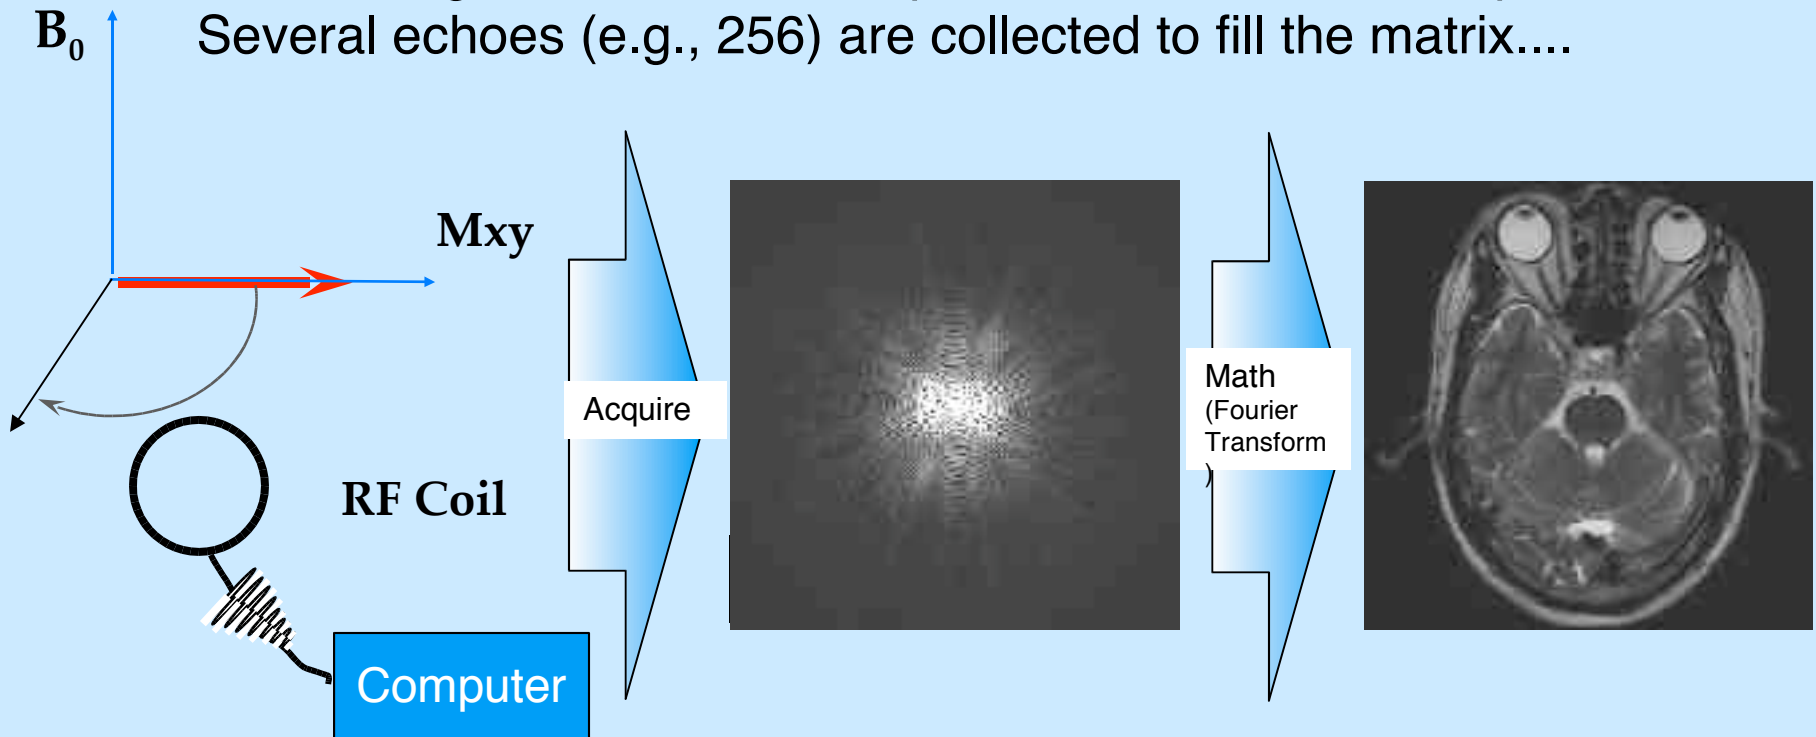

MRI Recipe

Step 4: Store measured radio wave data - Now go back to step 2 to get some more data

Step 5: Process raw data to reconstruct images.

The MR signal, or echo, is acquired and stored in a k-space matrix. Several echoes (e.g., 256) are collected to fill the matrix....

The Magnet

The Magnet

The magnet is the heart of a MR scanner, which directly related to image quality and cost decision.

Field strength

Homogeneity

Shimming

Siting ease

Cryogen consumption

Magnetic Field Strength – What is it?

Magnetic Field Strength is the measured intensity of magnetic field.

Magnetic field strength is measured in Tesla(T) or Gauss(G)
(1T = 10,000G)

Earth's magnetic field = 0.6 Gauss

FDA approved clinical MRI scanner $\leq 3T$

3T = 50,000 * earth magnetic field

0.2T

Effects of Increasing Field Strength

Parameter	Effect	Comments
SNR		Linear i.e. SNR at 3.0T = 2X SNR at 1.5T
Spectral Dispersion		Spectroscopy easier at higher fields – peaks are further apart
Fat Saturation		Easier at higher field as fat and water peaks are further apart
Dielectric Effects		Harder to get uniform RF field at higher magnet field strength... image shading
Acoustic Noise		Higher field strength magnets exert more force on conductors thereby generating more acoustic noise
Patient Physiological Effects		Vertigo, visual effects, metallic implant sensitivity increases
Magnetic Susceptibility		Better fMRI studies -higher BOLD signal;more artefacts
T1		Longer T1 relaxation time means scan protocols change with field strength
Chemical Shift		Higher chemical shift means scan protocols change with field strength

1.5T

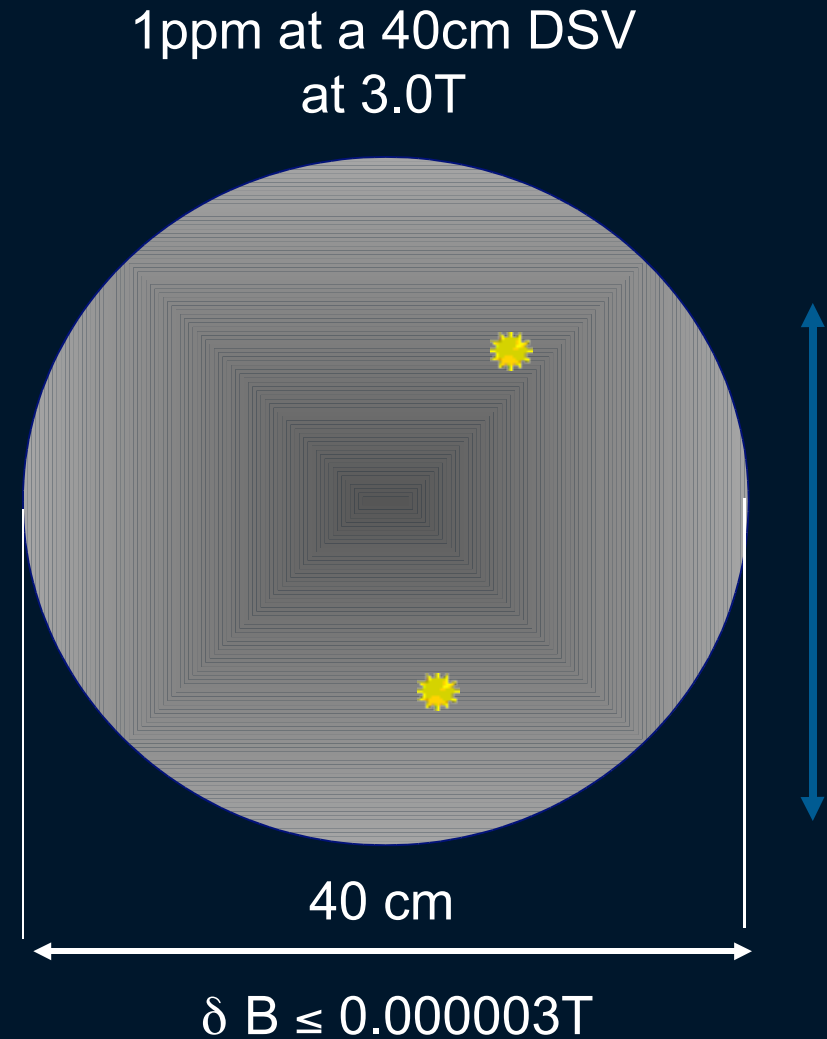

Homogeneity – What is it?

Homogeneity is defined as “part per million variation of the magnetic field over a given volume--DSV”

For example, at 1ppm homogeneity there is 1 part per million in the volume, that is not at the specified field strength

The significance of homogeneity increases as field strength increases.

Larmor Equation

$$\omega = \gamma B_0$$

Precessional
Frequency

HYDROGEN
(42.6)

Magnet
Field Strength

Homogeneity – Why Does it Matter?

In a homogeneous volume of tissue all spins (of the same type) have the same MR frequency

“Everybody’s radio is tuned to the right station” resulting in optimum signal and minimized artifacts

Homogeneity – Why Does it Matter?

In an inhomogeneous volume of tissue spins have a different MR frequency

“Some radios are tuned to the wrong station”

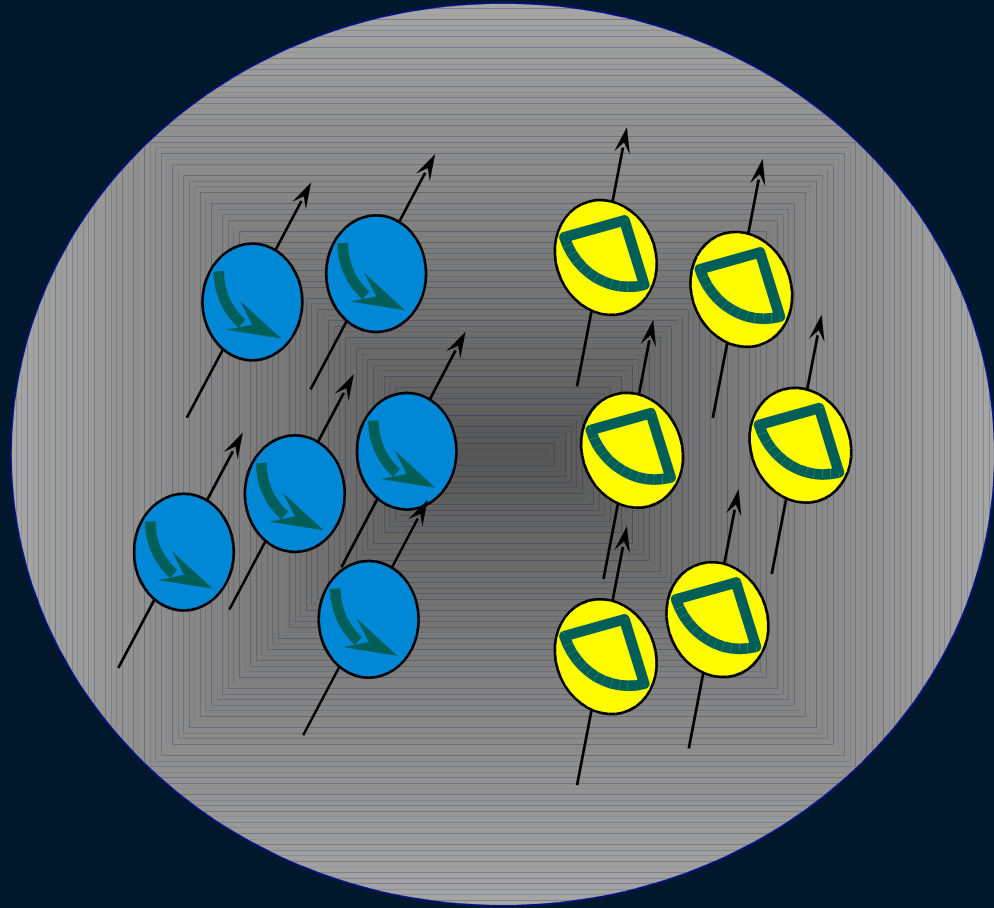

SNR degrades

FOV degrades

Off-center IQ degrades

Resolution degrades

FatSat is poor

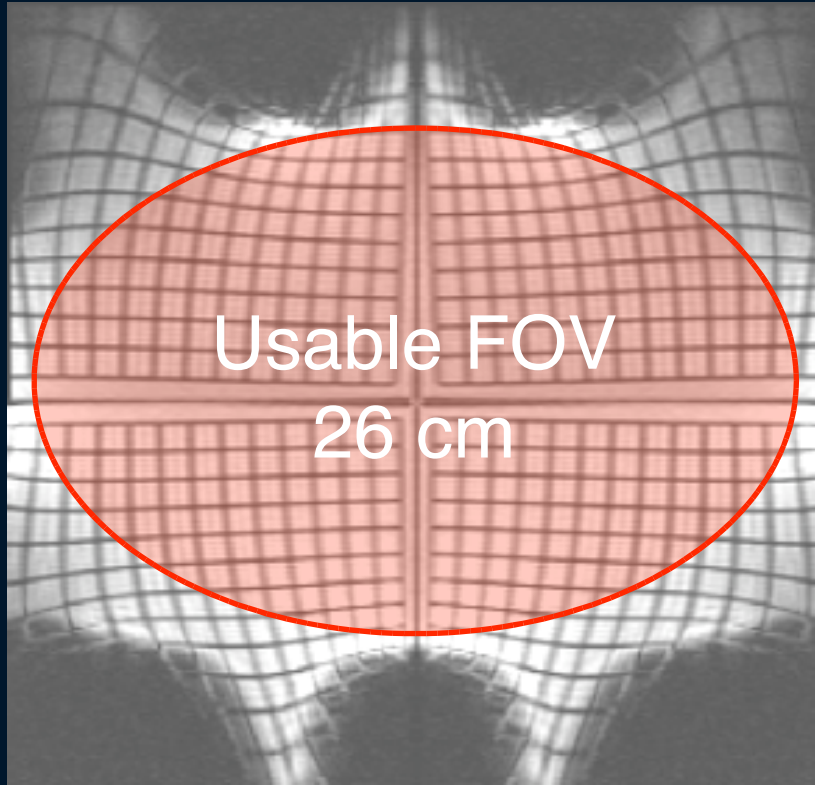

Homogeneity – Why Does it Matter?

Artifacts caused by magnet inhomogeneity cannot be corrected completely

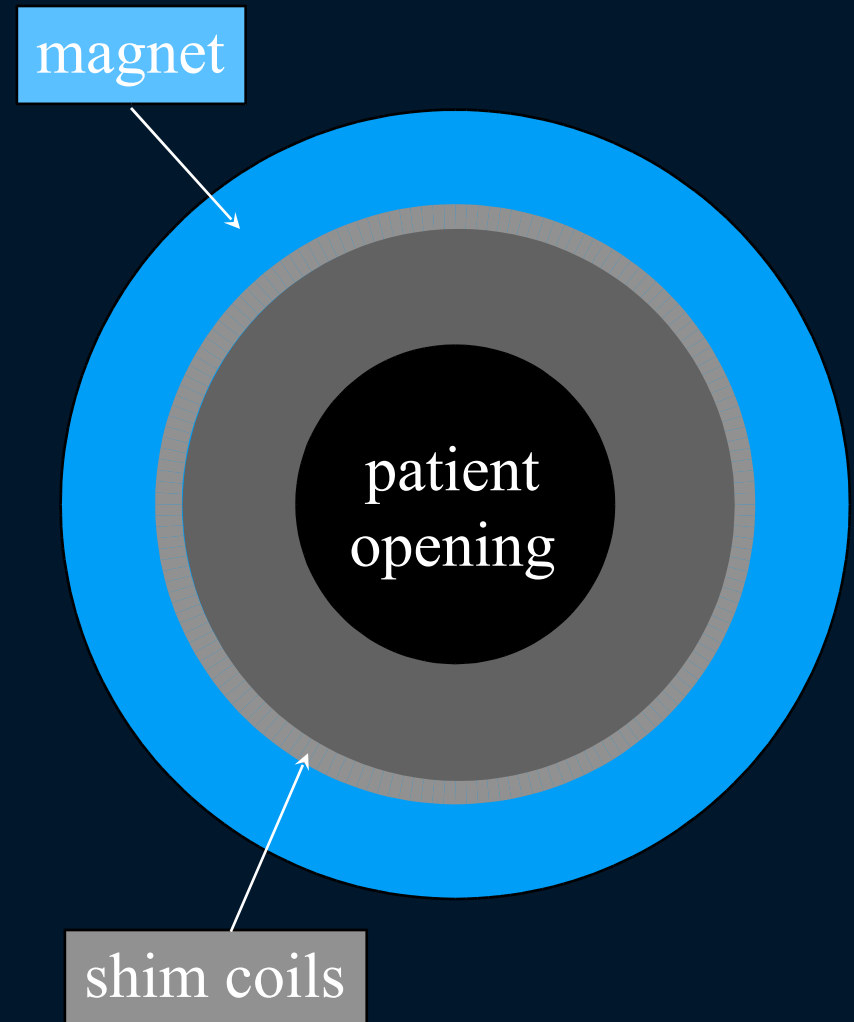

Homogeneity – Why Does it Matter?

Usable FOV Is Reduced

Shimming – What is it? Why Does it Matter?

- Shimming is the process of balancing the main magnetic field
- GE uses 18 super-conducting shim coils in order to provide the most stable environment
- Shimming is critical to the maintenance of homogeneity – it reduces residual inhomogeneity as well as patient induced inhomogeneity

Fringe Field – What is it? Why Does it Matter?

Fringe field is the extension of the magnet field beyond the magnet and is a significant factor in siting.

- ✓ Pacemakers outside 5 Gauss
- ✓ Color monitors outside 1 Gauss
- ✓ Nuclear Medicine outside .5Gauss

The Gradients

The Gradients - What is it?

Current-carrying coils designed to produce a desired gradient magnetic field which changes strength in a given direction.

No gradients (single resonant frequency)

Large gradient (highly resolved image)

$$\omega = \gamma B_0$$

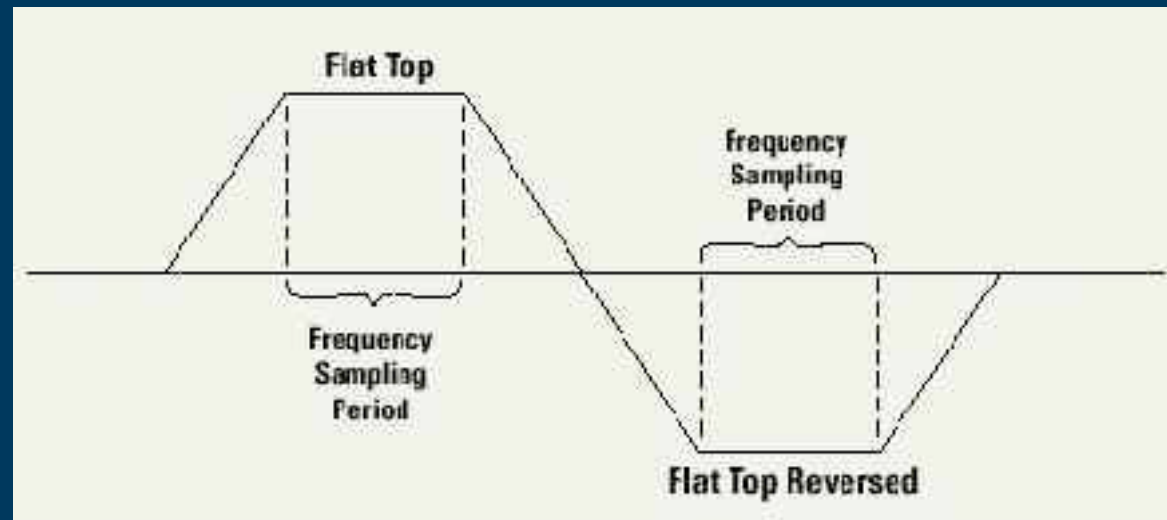

Major Gradients Specification

- Amplitude

Amplitude is measured as mT/m it reflects the rate of increase in the magnetic field – also known as the height of the gradient flat top

- Slew Rate

Slew Rate is measured as T/m/s it reflects how rapidly the gradient can be ramped to the height of the gradient flat top

Why do Gradient Amplitude and Slew Rate Matter?

-Gradient Specs Must Translate to Performance

Powerful Gradient

Weak Gradient

- RF Control Electronics
- Fast Play-out Pulse Sequence Memory

Reception

- Open Coil Interface
- Massively Parallel Channel Capability
- High Bandwidth & Dynamic Range

Processing

- High Speed Recon Engine
- Scalable to Support Massively Parallel Applications

RF Coil Portfolio

1. What is the difference between fMRI scanner and MR scanner? can we use fMRI for other applications ?
2. What is a RF coil ?
- 3.. Why need difference coil ?

1 or 3 inch coil

How does coil geometry affect image quality?

The RF Coil Portfolio

*The RF portfolio determines what applications you do
and how well you do them*

1ch T/R Head Coil vs 8ch Brain Coil

High Definition Spine Array

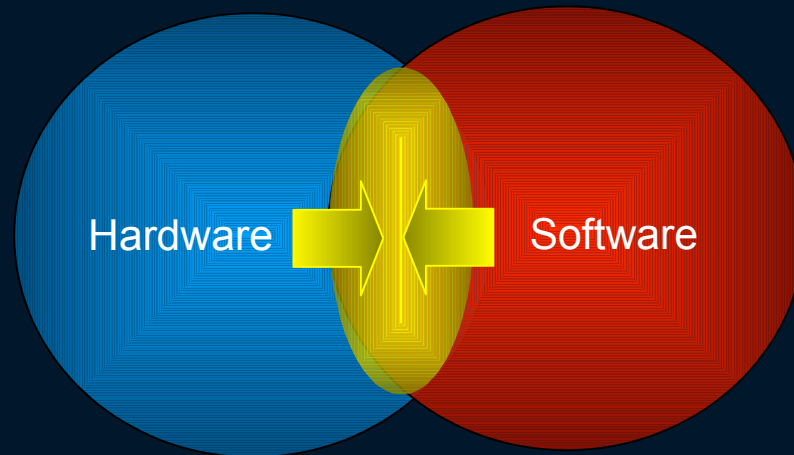

Transmit and Receive Knee and Foot Coil

Applications Portfolio

Good RF Coil Portfolio alone does not guarantee good applications. Complete application requires good software package together with good RF portfolio.

Signature Value – VIBRANT – Optimized Breast Imaging

Motion artifact  High resolution

Brainwave PA

The screenshot displays the BrainWave PA software interface. On the left, a patient information panel shows 'Patient: DEC070423' and 'Exam: 0000'. Below this is a 'Select Functional and Structural Components' section with 'Paradigm: Average-fMRI' and 'Overlay Type: Average-fMRI-f1'. A 'Thresholding' section shows a 'Z threshold' of 3.99. A 'BrainWaveSC Messages' section contains several log entries. The main area is a '3D viewer' showing a brain scan with a red activation spot circled in yellow. A red arrow points from this spot to three smaller views labeled 'axial', 'coronal', and 'sagittal', each also showing the red spot circled in yellow. The text 'Activation over anatomy in three planes' is overlaid in blue. The interface also includes various control panels for 'Display', 'Color', and 'Tools'.
